

**SAND2019-15281 R**

# **Build Guide for the Geophysical Monitoring System (GMS) Common Source Code 2019 Release**

James M. Harris  
Justin L. DuBois  
Katherine Z. Rivera  
David A. Manzanares

December 2019

Sandia National Laboratories is a multission laboratory managed and operated by National Technology and Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

## ABSTRACT

This document provides a “Build Guide” for a Generic Runnable System (GRS) of the Geophysical Monitoring Systems (GMS) common source code. This guide includes a list of software dependencies and licenses, hardware specifications, and instructions for how to build the system from the source code. The document is written for individuals who are experienced as administrators of Linux systems.

## CONTENTS

8.9.	Pruning the Docker System.....	25
9.	Debugging Common GMS Issues.....	26
Appendix A.	Third Party Software Bill of Materials (BoM).....	28

## 1. BUILD SYSTEM REQUIREMENTS

### 1.1. Build Server Prerequisites

**Note:** the build requires a working internet connection.

To build GMS, you will need:

- CentOS7, RHEL7 or Ubuntu 18.04
- Docker 18.09 or higher
- Docker-compose 1.24.0 or higher
- Gradle 4.10
- Java 9 (Note the GMS code base may not build with Java 11, Java 9 is a requirement rather than a suggested lower bound)
- Python3.6 (Note python 2 will not work)
- Maven (mvn 3.6.0)
- Node 8 or node 10 (Note Node 11 will not work)
- Chrome (version 75.+)

### 1.2. Ensure Credentials

Ensure that the user that is performing the build server installation has the appropriate permissions, such as being able to run “sudo” commands. This typically is done by adding the user to the sudoers list by running the “visudo” command.

### 1.3. GMS Software Repositories

GMS software is contained in these three repositories:

1. gms-common
2. docker-tree
3. xdc\_golden\_layout

Co-locate the 3 repos into one directory and set a "GMS\_INSTALL\_DIR" environment variable that is the full path to that directory. In the example below, “jdoe” is a placeholder for the username.

```
export GMS_INSTALL_DIR=<location of above folder>
```

For example: `export GMS_INSTALL_DIR=/usr/jdoe/gms/install`

Change to the full path on your machine to this folder.

```
cd $GMS_INSTALL_DIR
```

## 2. BUILD SYSTEM INSTALLATION

Instructions to install software needed for the GMS build system are provided for CentOS and Ubuntu; select the section appropriate to your system.

### 2.1. CentOS7

#### 2.1.1. *Installing Docker*

- `sudo yum update`
- `sudo yum -y install yum-utils device-mapper-persistent-data lvm2 wget unzip bzip2`
- `sudo yum-config-manager --add-repo https://download.docker.com/linux/centos/docker-ce.repo`
- `sudo yum -y install docker-ce`
- `sudo systemctl enable docker`
- `sudo systemctl start docker`
- `sudo usermod -aG docker $USER`

#### 2.1.2. *Verify Docker Version*

- `docker --version`

#### 2.1.3. *Installing Docker-compose*

- `sudo curl -L "https://github.com/docker/compose/releases/download/1.24.0/docker-compose-$(uname -s)-$(uname -m)" -o /usr/local/bin/docker-compose`
- `sudo chmod +x /usr/local/bin/docker-compose`

#### 2.1.4. *Verify Docker-compose Version*

- `docker-compose --version`

#### 2.1.5. *Installing Java*

- `wget https://download.java.net/java/GA/jdk9/9.0.4/binaries/openjdk-9.0.4_linux-x64_bin.tar.gz`
- `sudo tar xf openjdk-9.0.4_linux-x64_bin.tar.gz -C /opt`
- `rm -f openjdk-9.0.4_linux-x64_bin.tar.gz`
- `sudo ln -s /opt/jdk-9.0.4/bin/java /usr/local/bin`
- `sudo ln -s /opt/jdk-9.0.4/bin/javac /usr/local/bin`

#### 2.1.6. *Verify Java Version*

- `java --version`

### 2.1.7. *Installing Gradle*

- `wget https://services.gradle.org/distributions/gradle-4.10-bin.zip`
- `sudo unzip -d /opt gradle-4.10-bin.zip`
- `rm -f gradle-4.10-bin.zip`
- `sudo ln -s /opt/gradle-4.10/bin/gradle /usr/local/bin`

### 2.1.8. *Verify Gradle Version*

- `gradle --version`

### 2.1.9. *Installing Python*

- `sudo yum install -y https://centos7.iuscommunity.org/ius-release.rpm`
- `sudo yum update -y`
- `sudo yum install -y python36u python36u-libs python36u-devel python36-setuptools`
- `sudo ln -s /usr/bin/python3.6 /usr/local/bin/python`
- `sudo ln -s /usr/bin/python3.6 /usr/local/bin/python3`

### 2.1.10. *Verify Python Version*

- `python3 --version`

### 2.1.11. *Installing Maven*

- `curl -OL https://repo.maven.apache.org/maven2/org/apache/maven/apache-maven/3.6.0/apache-maven-3.6.0-bin.tar.gz`
- `sudo mkdir -p /opt`
- `sudo tar -xzf apache-maven-3.6.0-bin.tar.gz -C /opt`
- `rm apache-maven-3.6.0-bin.tar.gz`
- `sudo ln -s /opt/apache-maven-3.6.0 /opt/maven`
- `sudo vi /etc/profile.d/maven.sh`

```
# add the following to maven.sh file:
# Apache Maven Environmental Variables
export JAVA_HOME=/opt/jdk-9.0.4
export M2_HOME=/opt/maven
export MAVEN_HOME=/opt/maven
export PATH=${M2_HOME}/bin:${PATH}
```

- `sudo chmod +x /etc/profile.d/maven.sh`
- `source /etc/profile.d/maven.sh`

### 2.1.12. *Verify Maven Version*

- `mvn --version`

### 2.1.13. *Installing Node*

- `curl -sL https://rpm.nodesource.com/setup_10.x | sudo bash -`
- `sudo yum clean all && sudo yum makecache fast`
- `sudo yum install -y gcc-c++ make`
- `sudo yum install -y nodejs`

### 2.1.14. *Verify Node Version*

- `node --version`

## 2.2. **Ubuntu 18.04 LTS**

### 2.2.1. *Installing Docker*

- `sudo apt -y install apt-transport-https ca-certificates curl software-properties-common wget unzip bzip2`
- `curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add --`
- `sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable"`
- `sudo apt update`
- `sudo apt -y install docker-ce`
- `sudo usermod -aG docker $USER`

### 2.2.2. *Verify Docker Version*

- `docker --version`

### 2.2.3. *Installing Docker-compose*

- `sudo curl -L "https://github.com/docker/compose/releases/download/1.24.0/docker-compose-$(uname -s)-$(uname -m)" -o /usr/local/bin/docker-compose`
- `sudo chmod +x /usr/local/bin/docker-compose`

### 2.2.4. *Verify Docker-compose Version*

- `docker-compose --version`

### 2.2.5. *Installing Java*

- `wget https://download.java.net/java/GA/jdk9/9.0.4/binaries/openjdk-9.0.4_linux-x64_bin.tar.gz`
- `sudo tar xf openjdk-9.0.4_linux-x64_bin.tar.gz -C /opt`
- `rm -f openjdk-9.0.4_linux-x64_bin.tar.gz`
- `sudo ln -s /opt/jdk-9.0.4/bin/java /usr/local/bin`
- `sudo ln -s /opt/jdk-9.0.4/bin/javac /usr/local/bin`

### 2.2.6. *Verify Java Version*

- `java --version`

### 2.2.7. *Installing Gradle*

- `wget https://services.gradle.org/distributions/gradle-4.10-bin.zip`
- `sudo unzip -d /opt gradle-4.10-bin.zip`
- `rm -f gradle-4.10-bin.zip`
- `sudo ln -s /opt/gradle-4.10/bin/gradle /usr/local/bin`

### 2.2.8. *Verify Gradle Version*

- `gradle --version`

### 2.2.9. *Installing Python*

Python 3.6 is included in Ubuntu 18.04 by default; therefore, only the `setuptools` package needs to be installed:

- `sudo apt -y install python3-setuptools`

### 2.2.10. *Verify Python Version*

- `python --version`

### 2.2.11. *Installing Maven*

- `curl -OL https://repo.maven.apache.org/maven2/org/apache/maven/apache-maven/3.6.0/apache-maven-3.6.0-bin.tar.gz`
- `sudo mkdir -p /opt`
- `sudo tar -xzf apache-maven-3.6.0-bin.tar.gz -C /opt`
- `rm apache-maven-3.6.0-bin.tar.gz`
- `sudo ln -s /opt/apache-maven-3.6.0 /opt/maven`
- `sudo vi /etc/profile.d/maven.sh`

```
# add the following to maven.sh file:
# Apache Maven Environmental Variables
export JAVA_HOME=/opt/jdk-9.0.4
export M2_HOME=/opt/maven
export MAVEN_HOME=/opt/maven
export PATH=${M2_HOME}/bin:${PATH}
```

- `sudo chmod +x /etc/profile.d/maven.sh`
- `source /etc/profile.d/maven.sh`

### 2.2.12. *Verify Maven Version*

- `mvn --version`

### **2.2.13. *Installing Node***

- `curl -sL https://deb.nodesource.com/setup_10.x | sudo -E bash -`
- `sudo apt -y install gcc g++ make`
- `sudo apt -y install nodejs`

### **2.2.14. *Verify Node Version***

- `node --version`

## **2.3. *Install Chrome***

To exercise the full functionality of GMS, you will need to install the Chrome web browser on your machine. [Download Chrome](#)

### 3. USER ENVIRONMENT SETUP

- `export GMS_STACK=gms_idc`
- `export VERSION=latest`
- `export DOCKERTREE_VERSION=latest`
- `cd ${GMS_INSTALL_DIR}/gms-common/docker-compose-swarm`
- `cp template-env.sh release-env.sh`
- `vi release-env.sh`

Set the following variables with the proper settings pertaining to your specific environment.

**Note:** A single-network scenario is when the data acquisition services and the processing services reside on the same network. A multi-network scenario is when the two sets of services are on different networks and received data is copied from data acquisition to processing.

**IMPORTANT:** If in a single-network scenario, it is vital that you leave the multi-network variables declared, if the variables exist, in the file you are editing and that you make them empty strings (i.e. `CD11_RSYNC_JUMP_HOSTS:`)

#### **Single-network:**

**BASE\_DOMAIN:** represents the base domain of the wildcard DNS you have configured (i.e. `foo.bar.com`, `localhost`)

**CI\_DOCKER\_REGISTRY:** represents the docker registry from which the images came from (i.e. `localhost`)

**COLLECTION:** represents the collection that Docker UCP (web) uses to group the docker objects together in the UI (leave as is)

**SUBDOMAIN:** represents the subdomain which is prepended to the `BASE_DOMAIN` when accessing services externally (i.e. `sandbox`, `release`)

#### **Multi-network:**

**CD11\_RSYNC\_JUMP\_HOSTS:** represents the jump host the `cd11 rsync` service needs

**CD11\_RSYNC\_REMOTE\_HOST:** represents the remote host from which the `cd11` data is sent

**SEEDLINK\_RSYNC\_JUMP\_HOSTS:** represents the jump host the `seedlink` service needs

**SEEDLINK\_RSYNC\_REMOTE\_HOST:** represents the remote host from which the `seedlink` data is sent

- `source release-env.sh`

## 4. GMS BUILD INSTRUCTIONS

### 4.1. Build Docker base images

- `cd $GMS_INSTALL_DIR/docker-tree`
- `./prep-offsite-build.sh`
- `source env.sh`
- `./docker_tree.sh build --parallel`

### 4.2. Build gms-common repository code

To build the gms-common environment please follow the directions for each subdirectory below.

#### 4.2.1. *Java*

- `cd $GMS_INSTALL_DIR/gms-common/java`
- `vi gradle.properties`  
  

```
# artifactory_contextUrl should be a blank string
artifactory_contextUrl=
# The below proxy settings should be commented out, unless you need set
a proxy for your network needs.
#systemProp.http.proxyHost=
#systemProp.http.proxyPort=
#systemProp.http.nonProxyHost=
#systemProp.https.proxyHost=
#systemProp.https.proxyPort=
#systemProp.https.nonProxyHosts=
```
- `gradle build`

Note that in the gradle build command above, two unit tests are expected to fail. This does not preclude you to keep executing the next steps and does not prevent the setup to fail.

- `gradle docker`
- `gradle publishToMavenLocal`

#### 4.2.2. *nifi*

- `cd $GMS_INSTALL_DIR/gms-common/nifi`
- `mvn install`

#### 4.2.3. *Data Acquisition Frame Management*

- `cd $GMS_INSTALL_DIR/gms-common/docker/data-acquisition/frame-management-high/`
- `docker build --build-arg DOCKER_REGISTRY=${CI_DOCKER_REGISTRY} -t ${CI_DOCKER_REGISTRY}/data-acquisition-frame-management-high:${VERSION}`  
.

#### 4.2.4. *Data Acquisition IMS2*

- `cd $GMS_INSTALL_DIR/gms-common/docker/data-acquisition/ims2`
- `docker build --build-arg DOCKER_REGISTRY=${CI_DOCKER_REGISTRY} -t ${CI_DOCKER_REGISTRY}/gms/ims2_service:${VERSION} .`

#### 4.2.5. *etcd*

- `cd $GMS_INSTALL_DIR/gms-common/docker/etcd`
- `./docker-build-prep.sh`
- `docker build --build-arg DOCKER_REGISTRY=${CI_DOCKER_REGISTRY} -t ${CI_DOCKER_REGISTRY}/etcd:${VERSION} .`

#### 4.2.6. *Python*

- `cd $GMS_INSTALL_DIR/gms-common/python/master-coi-data-client`
- `python3 setup.py install`

Note that `sudo` may be required for this. This only needs to be done once. Subsequent runs can omit this step.

#### 4.2.7. *Typescript*

##### 4.2.7.1. *Building Golden Layout*

- `cd $GMS_INSTALL_DIR/xdc-golden-layout`
- `npm build`
- `sudo -E npm link`

##### 4.2.7.2. *Building the interactive-analysis-api-gateway*

- `cd $GMS_INSTALL_DIR/gms-common/node/interactive-analysis/interactive-analysis-api-gateway`
- `npm install`
- `npm run build`
- `npm run build-bundle`
- `docker build --build-arg DOCKER_REGISTRY=${CI_DOCKER_REGISTRY} -t ${CI_DOCKER_REGISTRY}/gms-common/interactive-analysis-api-gateway:${VERSION} .`

##### 4.2.7.3. *Building interactive-analysis-ui*

- `cd $GMS_INSTALL_DIR/gms-common/node/interactive-analysis/interactive-analysis-ui/packages/analyst-ui-core`
- `npm link @gms/golden-layout`
- `cd $GMS_INSTALL_DIR/gms-common/node/interactive-analysis/interactive-analysis-ui`
- `npm install`
- `npm run bootstrap`

- `npm run build`
- `docker build --build-arg DOCKER_REGISTRY=${CI_DOCKER_REGISTRY} -t ${CI_DOCKER_REGISTRY}/gms-common/interactive-analysis-ui:${VERSION} .`

#### 4.2.8. *Station Reference Loader*

- `export STATION_REF_BASE=${GMS_INSTALL_DIR}/gms-common`
- `cd $STATION_REF_BASE/config/station-reference`
- `./docker-build-prep.sh`

Note that if you ran this command at least once already, it will fail every consecutive time due to the `station_ref_data` directory already existing. To run again, delete the `station_ref_data` directory first by running the following command then running the `docker-build-prep.sh` command again.

- `rm -r station_ref_data`

Run the following commands.

- `cd $STATION_REF_BASE/config/station-reference`
- `docker build --build-arg DOCKER_REGISTRY=${CI_DOCKER_REGISTRY} -t ${CI_DOCKER_REGISTRY}/station-ref-loader:${VERSION} .`

## 5. TESTBED SYSTEM INFORMATION

For information only, this section contains basic requirements and setup instructions for the GMS testbed system. This information will be more fully described in a subsequent report.

### 5.1. Docker CE Deployment Requirements

#### 5.1.1. Hardware Requirements

- 1 machine (or VM) with at least these specs:
  - 16 CPUs
  - 64 GB RAM
  - 600 GB free disk space

#### 5.1.2. Software Requirements

- CentOS 7.1, RHEL 7.4 or Ubuntu >= 18.04
- Docker CE >= 18.09

The following third-party dependencies will run as part of the deployment process in addition to the bill of materials listed in Appendix A. This third-party software is required to run GMS.

- Postgres version 9.5.14
- Cassandra version 3.11.2
- Nginx version 1.16.1
- Traefik version 1.7.14
- Zookeeper version 3.4.6
- HDF Nifi version 3.2.0
- HDF Nifi-registry version 3.2.0

### 5.2. Docker CE Installation

To install Docker CE, follow the Docker guide according to your linux distribution:

[Install Docker CE on CentOS](#)

[Install Docker CE on RHEL](#)

[Install Docker CE on Ubuntu](#)

### 5.3. Docker CE Post-Install

For linux installs, it is recommended that you review these [post-install instructions](#). At a minimum, follow the "[Starting on Boot section](#)".

### 5.4. Docker CE Swarm Configuration

To create your swarm, follow the <https://docs.docker.com/engine/swarm/swarm-tutorial/create-swarm/> hyperlink (as a reference) to create a single node swarm. Note: You will already be on the node you want as the manager node.

To create a new swarm, run the following command:

- `docker swarm init --advertise-addr <MANAGER-IP>`

Note: If you are using Docker Desktop for Mac or Docker Desktop for Windows, just run the `docker swarm init` command with no arguments.

## 5.5. Node Constraints

Docker Swarm allows more than one node to be part of a cluster. For GMS to work, it is necessary to "pin" certain services to run on one node in order to correctly share disk storage and to guarantee consistent volume allocation. These instructions will "pin" all the necessary services to your single node. To accomplish this, from the manager node (terminal) you will run the following commands:

- `cd $GMS_INSTALL_DIR/gms-common/docker-compose-swarm`
- `./set_constraints.sh`

## 5.6. Wildcard DNS

Setting up a wildcard DNS is necessary to expose the docker host for user access and send HTTP requests to the services using an easily formatted URL configured by traefik. The alternative to a wildcard DNS solution would be to expose the ports in the docker-compose file. HTTP access to the services would then be granted through `<host>:<port>` and traefik would be bypassed. Since traefik is deployed with the GMS system and comes pre-configured, instructions here are for a wildcard DNS solution. For more help on how to configure a `<host>:<port>` solution in docker-compose, follow [this Docker guide](#).

Using the example below, log in to your DNS server and create a new zone file:

### 5.6.1. Example zone file for wildcard DNS

```
$TTL 3600          ; 1 hour
@                IN      SOA      taurus.example.com. dnsadmin.example.com. (
                                2          ; serial
                                1800       ; refresh (30 minutes)
                                900        ; retry (15 minutes)
                                604800    ; expire (1 week)
                                3600      ; minimum (1 hour)
                                )
@                NS       ns3.example.com.
@                NS       ns4.example.com.
```

### 5.6.2. Section to add to enable wildcard DNS

Change the below IPs appropriately:

```
; zone name
                                A          192.0.2.4
; wildcard
*                                A          192.0.2.4
```

## 6. SYSTEM CONFIGURATION

### 6.1. Configure live data parameters

#### 6.1.1. CD11

The cd11 data transfer protocol relies heavily on static IPs and Ports. Edit the da-connmman and da-dataman services in the `$GMS_INSTALL_DIR/docker-compose-swarm/docker-compose-swarm-data-acq.yml` file to make them match the following snippets (i.e. Add the "environment" sections from below):

da-connmman:

```
image: ${CI_DOCKER_REGISTRY}/gms-common/cd11-connmman:latest
environment:
  connectionManagerIpAddress: <Updated to the host machine's IP>
  connectionManagerPort: 8041
  dataProviderIpAddress: 198.47.84.103
ports:
  - "8041:8041"
deploy:
  labels:
    - "com.docker.ucp.access.label=${COLLECTION}"
  restart_policy:
    condition: on-failure
```

da-dataman:

```
image: ${CI_DOCKER_REGISTRY}/gms-common/cd11-dataman:latest
environment:
  fsOutputDirectory: /dare-receiver/shared-volume/dataframes/
  expectedDataProviderIpAddress: 198.47.84.103
  dataConsumerIpAddress: <Updated to the host machine's IP>
volumes:
  - cd11:/dare-receiver/shared-volume:rw
ports:
  - "8100-8110:8100-8110"
deploy:
  placement:
    constraints:
      - node.labels.${SUBDOMAIN}.cd11-data-acq == true
  labels:
    - "com.docker.ucp.access.label=${COLLECTION}"
```

```
restart_policy:
  condition: on-failure
```

Notes:

- Both `connectionManagerIpAddress` and `dataConsumerIpAddress` need to be updated to the IP of the host machine
- You may need to update the ports, depending on your network

## 6.2. Configure traefik

You will need to know the values of your `$BASE_DOMAIN` and `$SUBDOMAIN` that you defined in your `$GMS_INSTALL_DIR/gms-common/docker-compose-swarm/release-env.sh` file. To view the values run the following commands:

- `echo $SUBDOMAIN`
- `echo $BASE_DOMAIN`

You will need to substitute these literal values in the following portions of `$GMS_INSTALL_DIR/docker-compose-swarm/docker-compose-swarm-traefik.yml` in your favorite text editor.

NOTE: Make sure to change any pre-configured environment names that are there already, i.e. `sandbox/release`, to what is show below.

NOTE: For simplicity, use the literal name of the subdomain in the strings below (the environment variable could be used except in the "networks" section)

Edit the traefik settings in the "deploy" section of the traefik service to match the following:

- `"traefik.docker.network=traefik-net-<subdomain>"`
- `"traefik.port=8080"`
- `"traefik.frontend.rule=Host:traefik.<subdomain>.<base domain>"`

Edit the "networks" section under the traefik service to match:

```
networks:
  - traefik-net-<subdomain>
  - traefik-net-data-diode
```

Lastly, edit the "networks" section at the bottom of the file so that the network names match:

```
traefik-net-<subdomain>:
  name: traefik-net-<subdomain>
  .
  .
  .
traefik-net-data-diode:
  name: traefik-net-data-diode
```

## 7. DEPLOYMENT

### 7.1. Deploy the software

- `cd $GMS_INSTALL_DIR/gms-common/docker-compose-swarm`
- `docker stack deploy --prune --compose-file docker-compose-swarm-traefik.yml gms_traefik`
- `docker stack deploy --prune --compose-file docker-compose-swarm-gms.yml ${GMS_STACK}`
- `docker stack deploy --prune --compose-file docker-compose-swarm-data-acq.yml gms_data_diode`
- To verify that there are three stacks running, run the following command:  
`docker stack ls`

Note that the following commands may need to be performed:

- `docker ps | grep gms_data_diode_nifi-data-acq`
- Capture the docker container name or ID and run the following commands:  
`docker exec -it <id> bash`  
`mkdir /grid/frames/dataframes/`  
`mkdir /grid/frames/frame-transfer/`  
`chown -R 1001:root /grid/dataframes`  
`chown -R 1001:root /grid/frame-transfer`  
`exit`

### 7.2. Load the Station Reference Information

- `docker run -it --rm --network traefik-net-${SUBDOMAIN} ${CI_DOCKER_REGISTRY}/station-ref-loader:${VERSION}`

Note that there should be no error messages displayed.

### 7.3. Load the data-acq database with Station References

- `docker run -it --rm --network traefik-net-data-diode ${CI_DOCKER_REGISTRY}/station-ref-loader:${VERSION}`

Note that there should be no error messages displayed.

### 7.4. Setting Signal Detection Channel IDs

- `host=osd-signal-detection-repository-service.${SUBDOMAIN}.${BASE_DOMAIN}`
- `curl -d '{"id": "b9030816-6b17-4f4c-8124-c3b6d871772d", "type": "BEAM", "channelIds": ["4be5496e-3f24-3f6e-9f40-868b50aea26a", "4c09c855-7080-3aa8-ae54-8f2be946cf92", "214d6ca6-982d-3d8a-9094-c9088b43f8db", "3b312784-52be-3fb9-a177-954864574a1e", "5b720616-bcc4-377f-8c6c-33f6317025f2", "34034f2c-8596-3d79-9f83-f4a62462eb4a", "7bc9a245-3b77-3442-a1a2-7ff6990e3251", "8825b92e-ad3d-35ea-9e86-46fed2a0fb19", "13620c54-8a9a-3037-a57b-8b31fc0985e5", "80ca3b13-1f2e-3327-af55-719624426f7d", "f0cd9195-7155-377e-9ad4-f25deed6f39f", "7da5ee41-35d3-3d79-aa2c-`

```

## 7.5. Load GMS NiFi processors

To verify that there are 2 docker containers running, run the following command:

- ```

docker ps | grep ${GMS_STACK}_nifi

```

## 7.6. Run Copy NARs Script and Restart Services

- `cd $GMS_INSTALL_DIR/gms-common/nifi/`
- `./copy_nars.sh`
- `docker service scale ${GMS_STACK}_nifi=0`
- `docker service scale ${GMS_STACK}_nifi=1`
- `docker service scale gms_data_diode_nifi-data-acq=0`
- `docker service scale gms_data_diode_nifi-data-acq=1`

## 7.7. Load GMS NiFi template

- Open up a browser and navigate to the GMS NiFi UI. The URL should be in this format: `http://nifi.<subdomain>.<base domain>/nifi`
- In the "Operate" box on the left hand side, find the "Upload Template" button and click it.
- On your machine, find the GMS NiFi template file, located at `$GMS_INSTALL_DIR/gms-common/nifi/templates/7-5-0-gms-nifi-template.xml`, and upload it.
- After it was successfully uploaded, at the top of the NiFi UI, drag the template icon onto the blank workflow area (typically the 2nd icon from the right side).
- Select the template that you uploaded and click the "ADD" button.
- Right click anywhere in the blank workflow space and click "Start"
- Double click on the Station Processing group
- Double click on the GetProcessingGroupId group
- Double click on the LookupProcessingGroupId processor (box)
- Click the Properties tab
- Click on the "Go To" arrow on the right hand side of Lookup Service
- Click on Enable (lightning bolt) on the right hand side
- Click the Enable button.
- Click the Close button.
- Click the X (top right) button.
- Right click the LookupProcessingGroupId processor and click Start
- In the top right hand corner of the NiFi UI, click the settings icon (the "hamburger").
- Click "Controller Settings" and change the "Maximum timer driven thread count" to 100.
- Click the Apply button.
- Click the OK button.
- Click the X (top right) button.

## 7.8. Load data-acq NiFi template

- If you have not already, open a browser and navigate to the GMS NiFi UI. The URL should be in this format:  
`http://nifi.<subdomain>.<base domain>/nifi`
- In the "Operate" box on the left hand side, find the "Upload Template" button and click it.
- On your machine, find the GMS NiFi template file, located at `$GMS_INSTALL_DIR/gms-common/nifi/templates/7-5-0-data-acq-nifi-template.xml`, and upload it.
- After it was successfully uploaded, at the top of the NiFi UI, drag the template icon onto the blank workflow area (typically the 2nd icon from the right side).
- Select the template that you uploaded and click the "ADD" button.
- Right click anywhere in the blank workflow space and click "Start"

## 8. MAINTENANCE

Here you will find instructions for common maintenance tasks you may need to perform on the system. Each task below assumes that you are connected to the docker swarm cluster via UCP on a terminal.

### 8.1. Starting the System

Ensure that the Deployment section has been completed successfully. Run the following commands. Note that the startup order is important. This section is included here for reference only.

- `docker stack deploy -prune -compose-file docker-compose-swarm-traefik.yml gms_traefik`
- `docker stack deploy -prune -compose-file docker-compose-swarm-gms.yml ${GMS_STACK}`
- `docker stack deploy -prune -compose-file docker-compose-swarm-data-acq.yml gms_data_diode`

### 8.2. Stopping the System

Run the following commands. Note that the shutdown order is important.

- `docker stack rm gms_data_diode`
- `docker stack rm ${GMS_STACK}`
- `docker stack rm gms_traefik`

### 8.3. Wiping the System

To completely wipe the system, you must stop the system as well as remove the persistent volumes. To remove the volumes, follow these steps:

- List the names of the volumes by running the following command:  
`docker volume ls`
- Copy and paste the name of each volume that you are going to remove from each stack (gms and data diode) into the following command for each volume:  
`docker volume rm <volume name>`

Note: If you get an error indicating that a volume cannot be removed because of a container that is still holding onto the volume, follow these steps:

- Grab the container ID from the error message
- Verify the container exists and is in an "Exited" state by running the following command:  
`docker ps | grep Exited`
- If the container is not in an "Exited" state, that means the stack has not been brought down yet. Stop now and remove the stack first. You can determine which stacks are running by running the following command:  
`docker stack ls`
- Run the following command:  
`docker rm -f <container ID>`

- Remove the following command again:  
`docker volume rm <volume name>`

## 8.4. Reloading Data

In the case that you need to reload the database and the API gateway, you must bring down the GMS services and delete some volumes.

- Scale down the services to 0 by running the following command:  
`docker service ls -f "name=${GMS_STACK}" -q | xargs -I % docker service scale -d %=0`
- Run the following command:  
`docker volume ls -f "name=${GMS_STACK}"`
- Delete only the GMS PostgreSQL database (not the data-acq PostgreSQL database), Cassandra database and api-gateway volumes by running the following commands:  
`docker volume rm <gms postgres volume name>`  
`docker volume rm <api-gateway volume name>`  
`docker volume rm <cassandra volume name>`

Note: If you get an error, see the note under the "Wiping the System" section above

- Deploy the stack by running the following command:  
`docker stack deploy --prune --compose-file docker-compose-swarm-gms.yml ${GMS_STACK}`
- Rerun the data loading portion of the deploy section for the databases and api-gateway
- If you want to reload NiFi, follow the same process, but delete the NiFi volume instead and reload NiFi data from the deploy section

## 8.5. Exec'ing into a Container

In the case that you need to "login" ("exec") to the container, for example to browse files within it, follow these steps:

- Run the following command:  
`docker ps | grep <service name> (e.g. docker ps | grep osd-signalddetection)`
- Grab the container ID
- Run the following command:  
`docker exec -it <container ID> bash`
- You are now inside the container
- When finished, type exit

## 8.6. Viewing Services and Logs

In the case that you need to debug by viewing services and logs, follow these steps:

- Run the following command to view all the services across every stack:  
`docker service ls`
- Run the following command to view an individual service:  
`docker service ls | grep <service name>`

- Run the following command to view service logs for a service:  
`docker service logs <service name>` (use the -f option to follow the logs)

## 8.7. Viewing Docker System Stats

In the case where you need to troubleshoot system-wide problems and gather system information about the docker cluster, follow these steps:

- Run the following command to show information about the entire docker system like CPU and memory, including node information as well:  
`docker system info`
- Run the following command to show information about the disk space that's used and available in the cluster:  
`docker system df`

## 8.8. Restarting Services

In the case where you need to restart services, follow these steps:

- Run the following command:  
`docker service scale <service name>=0`
- Once the service is completely down, to bring it back up run the following command:  
`docker service scale <service name>=1`

## 8.9. Pruning the Docker System

It is common for objects like images, containers and volumes in the docker system to become outdated and stale after a series of container's restarts, multiple deployments, etc. To clear the docker system of these unused objects, follow the following steps:

Note: As of now, UCP does not support cluster-wide prune operations, so you must log into the node which you want to prune.

- Log in (ssh) to the node of your choice
- Run the following command:  
`docker system prune`
- Type 'y' and hit enter
- If you would like to clean unused volumes as well, run the following command:  
`docker system prune -volumes`

## 9. DEBUGGING COMMON GMS ISSUES

Symptom	Possible Cause	Verification	Resolution
500 Internal Server Errors from OSD Services	Out of Storage Space	Check for near 100% disk utilization for the Node running Postgres and/or Cassandra	Wiping Databases
	Out of PSQL Connections	docker exec into the postgres container, connect to the db: psql xmp_metadata xmp, and run: <code>SELECT sum(numbackends) FROM pg_stat_database;</code> The limit is 100.	Clear the idle connections: <pre>select pg_terminate_backend(pg_stat_activity.pid) from pg_stat_activity where pg_stat_activity.datname = 'xmp_metadata' and pid &lt;&gt; pg_backend_pid();</pre>
No Live Data in Nifi	Low-side Data Acquisition could be down	Check the data-diode services are running and that nifi-data-acq.\$SUBDOMAIN.\$BASE_DOMAIN is populated and running.	Double-check that the deployment procedures listed in the deployment section were followed. Check storage usage.
	IP Addresses are wrong for CD1.1	Double-check that the IP Addresses for dataman and conman in data-acq are set to the values of their pinned swarm nodes.	Update docker-compose-data-acq.yml accordingly and review the deployment section.
	CD1.1 Data Provider not configured to forward to your service	Verify with the data provider that your conman IP has been added	Request the admin add it if not already added
	Kafka Stack and Data Diode Stack not co-located on the same Node	The Kafka and Data Diode Stack need to all be located on the same node to share the dataframe volume. Verify they are all running on the same Node and only have one volume	Apply labels to the services and node as necessary to limit them to the same node.

Symptom	Possible Cause	Verification	Resolution
	Dataframes are not moving due to permissions issues or something else	<code>docker exec</code> into frame-management and check that there are frames moving from <code>/shared-volume/rsynced-files</code> to <code>/shared-volume/dataframes</code> . If you don't see any files or there are files backing up, then it's likely a service isn't running or doesn't have access to those files.	Check that permissions allow <code>rw</code> to anyone and that all services are healthy
Flow Files Backing up in Nifi	Not Enough Threads Added	Check that the Number of Maximum Timer Driven Threads and Event Driven threads in Nifi (Menu -> Controller Settings -> General) are at least 100 and 5 respectively	Configure as necessary

## APPENDIX A. THIRD PARTY SOFTWARE BILL OF MATERIALS (BOM)

The following is a list of third party software dependencies for GMS common.

Component Name	Component Version	License	Needed by
Pyparsing	2.4.2	MIT License	gms-common-python-master-coi-data-client
idna	2.8	BSD 3-clause "New" or "Revised" License	gms-common-python-master-coi-data-client
